

Family and HIV/AIDS: Cultural and Contextual Issues in Prevention and Treatment

Three decades into the HIV pandemic, the goals remain clear: reduce the number of infections, improve the health outcomes of those who are infected, and eliminate disparities in care. And one observation continues to gain credence: families are a powerful resource in preventing, adapting to, and coping with HIV. Recognizing their complex role as educators, mentors, and caregivers, *Family and HIV/AIDS* assembles a wealth of findings from successful prevention and intervention strategies and provides models for translating evidence into effective real-world practice. Chapters spotlight the differing roles of mothers and fathers in prevention efforts, clarify the need for family/community collaborations, and examine core issues of culture, ethnicity, gender, and diagnosis (e.g., minority families, adolescents with psychological disorders). Throughout, risk reduction and health promotion are shown as a viable public health strategy. A reference with considerable utility across the health, mental health, and related disciplines, *Family and HIV/AIDS* will be a go-to resource for practitioners working with families, researchers studying at-risk populations, administrators seeking to create new (or evaluate existing) prevention and care programs, and policymakers involved in funding such programs.
